

Will vanadium flow batteries exceed lithium-ion batteries?

He predicts that in the next 5 to 10 years, the installed capacity of vanadium flow batteries could exceed that of lithium-ion batteries. This announcement aligns with the recent formation of the Central Enterprise New Energy Storage Innovation Consortium.

What is a vanadium flow battery?

Technological Advancements in Energy Storage Vanadium flow batteries are currently the most technologically mature flow battery system. Unlike lithium-ion batteries, Vanadium flow batteries store energy in a non-flammable electrolyte solution, which does not degrade with cycling, offering superior economic and safety benefits.

Why are vanadium redox flow battery systems important?

Battery storage systems become increasingly more important to fulfil large demands in peaks of energy consumption due to the increasing supply of intermittent renewable energy. The vanadium redox flow battery systems are attracting attention because of scalability and robustness of these systems make them highly promising.

How does corrosive vanadium electrolyte affect battery performance?

The graphite BPs in the corrosive vanadium electrolyte is easily eroded due to CO₂ gas evolution on the positive side of the VRFB electrode [92,93]. The severe heterogeneous surface corrosion results in electrolyte leakage across the BP that significantly deteriorates the battery performance, which ultimately leads to battery failure.

How does a vanadium battery store electrical energy?

In order to store electrical energy, vanadium species undergo chemical reactions to various oxidation states via reversible redox reactions (Eqs. (1) - (4)). The main constituent in the working medium of this battery is vanadium which is dissolved in a concentration range of 1-3M in a 1-2M H₂SO₄ solution.

Does a flow field increase the distribution uniformity of vanadium electrolytes?

This implies that the addition of a flow field can effectively increase the distribution uniformity of the vanadium electrolytes in the porous electrode, especially at smaller flow rates.

Innovative membranes are needed for vanadium redox flow batteries, in order to achieve the required criteria; i) cost reduction, ii) long cycle life, iii) high discharge rates and iv) high current densities. To achieve this, variety of materials were tested and reported in literature.
