

## Analysis of the prospects of chemical energy storage field

Why is energy storage research important?

It helps the academic and business communities understand the research trends and evolutionary trajectories of different energy storage technologies from a global perspective and provides reference for stakeholders in their layout and selection of energy storage technologies.

What is chemical energy storage?

Chemical energy storage mainly includes hydrogen storage and natural gas storage. In hydrogen storage, hydrogen is produced through direct or electrolytic methods, with electrolysis of water being a common method. The energy required for this process also needs to be provided by other fossil fuels or RE sources [39,40].

Why is electrochemical energy storage important?

The main reasons for these results may be as follows: Firstly, technology maturity and commercial applications: Among existing energy storage technologies, electrochemical energy storage is the most widely applied . It has a higher degree of technical foundation and commercialization, which attracts more research interests and investment.

How important is sizing and placement of energy storage systems?

The sizing and placement of energy storage systems (ESS) are critical factors in improving grid stability and power system performance. Numerous scholarly articles highlight the importance of the ideal ESS placement and sizing for various power grid applications, such as microgrids, distribution networks, generating, and transmission [167,168].

Why do we need a large-scale development of electrochemical energy storage?

Additionally, with the large-scale development of electrochemical energy storage, all economies should prioritize the development of technologies such as recycling of end-of-life batteries, similar to Europe. Improper handling of almost all types of batteries can pose threats to the environment and public health .

Which universities are leading in chemical energy storage?

In the field of chemical energy storage, Zhejiang University, South China University of Technology, National Institute of Standards and Technology in the United States, Aarhus University, Kyushu University, National Institute for Advanced Industrial Science and Technology, Hiroshima University, and Tohoku University have been consistently leading.

Studies have been carried out by Bloomberg New Energy Finances (BNEF) found that 55% of storages built before 2030 will provide a shift in energy consumption (transfer of consumption of "green" power plants for a time with higher demand) and the growing probability of building coupled facilities in which RES (especially
