

Battery technology is simply not good

Are batteries the lifeblood of Tech?

Batteries are the lifeblood of tech. In 1990, just as lithium-ion was poised to flood the market, worldwide demand for batteries reached nearly 200,000 megawatt-hours, according to estimates from consulting firm Avicenne Energy. That's the equivalent of 44.4 billion Energizer Ultimate Lithium AA batteries, enough to circle Earth nearly 57 times.

Will new battery technology ever see the market?

It's hard to write about battery research around these parts without hearing certain comments echo before they're even posted: It'll never see the market. Cold fusion is eternally 20 years away, and new battery technology is eternally five years away.

Is battery technology becoming more economical?

The good news is the technology is becoming increasingly economical. Battery costs have fallen drastically, dropping 90% since 2010, and they're not done yet. According to the IEA report, battery costs could fall an additional 40% by the end of this decade.

Are lithium-ion batteries getting better?

Cold fusion is eternally 20 years away, and new battery technology is eternally five years away. That skepticism is understandable when a new battery design promises a revolution, but it risks missing the fact that batteries have gotten better. Lithium-ion batteries have reigned for a while now--that's true.

Are batteries the future of energy?

The planet's oceans contain enormous amounts of energy. Harnessing it is an early-stage industry, but some proponents argue there's a role for wave and tidal power technologies. (Undark) Batteries can unlock other energy technologies, and they're starting to make their mark on the grid.

Why is battery technology so slow?

They give us longer-lasting smartphones, anxiety-free electric transport, and potentially, more efficient energy storage for large-scale buildings like data centers. But battery tech is frustratingly slow to advance, due to both the chemical processes involved and the challenges that exist around commercializing new battery designs.

But it's not clear whether these batteries will be able to meet needs for EV range and charging time, which is why several companies going after the technology, like US-based Natron, are ...

In fact, many researchers believe energy storage will have to take an entirely new chemistry and new physical form, beyond the lithium-ion batteries that over the last ...

New battery technology aims to provide cheaper and more sustainable alternatives to lithium-ion battery technology. New battery technologies are pushing the limits on performance by increasing energy density (more power in a smaller size), providing faster charging, and longer battery life. What is the future of battery technology?
