

**Capacitor step-down operation** 

A new approach for capacitive step-down converters that use a linear mode pre-regulator for improved load regulation is discussed. The pre-regulator replaces the pulse width modulation or pulse skipping regulation of conventional capacitive step-down converters by an cycle which minimizes the output voltage ripple. Under

The principle of capacitor step-down is not complicated. His working principle is to use the capacitive reactance generated by a capacitor at a certain AC signal frequency to limit the maximum operating current. For example, under 50Hz power frequency conditions, the capacitive reactance generated by a 1uF capacitor is about 3180 ohms. When ...

This paper presents a new highly integrable hybrid step-down converter that merges switched-inductor and switched-capacitor operations and significantly reduces onboard loss by using the input cable"s parasitic inductance as its main inductor. This converter has the inductor placed at the input with a smaller voltage swing, leading to possible use of a smaller inductor and low ...

step-down converters is fulfilling the capacitance requirement of the energy-transfer and filter elements. Class II multi-layer ceramic capacitors are used in SC and hybrid converter

Abstract--A closed-loop scheme of adaptive switched-capacitor converter (ASCC) is presented by combining a phase generator and non-overlapping circuit to realize the switched-capacitor-based (SC) step-down conversion for piezoelectric energy harvesting.

signed and the operation of the proposed converter is ex-perimentally verified including the resonant operation of IGCTs which results in significantly reduced switching losses. IINTRODUCTION For several years now, the switched capacitor con-cept has been applied for DC-DC voltage conversion (SCDCDC). Especially for power supplies of micro-controllers, ...

The step-down DC-DC conversion involves the time-division of a DC voltage (which is referred to as V IN) by means of a switch and smoothing of the results by means of an inductor and capacitor to produce a desired DC voltage. The figure on the right depicts a conceptual circuit for step-down DC-DC conversion and its operation.

Conventional switched capacitor filter circuits require a number of capacitors for their implementation with attendant complexity, efficiency and power density costs.

HSC combines the benefits of switched-capacitor converters and the high step-down ratio capability of transformer-based converters. By transferring energy through capacitors and a magnetic device, efficiency and power density can be significantly improved. a) b) Figure 1 Two-stage approach from 48 V to point of load

This paper proposes a analysis of a LED driver. The driver consists of a resonant switched capacitor converter designed to operate in CCM and fed from nanogrid. This mode of operation allows the reduction of current peaks and, consequently, reduction of conduction losses. There is ZVS in the turn-off of the switches due to the full charge and ...

This paper treats a new type of high power switched-capacitor-DC-DC-converter (SCDDC), which is characterized by resonant switching transitions. This drastically reduces switching losses and opens up the possibility to employ thyristors instead of turn-off power semiconductors. At the same time a larger energy can be transferred per switching cycle ...
