What is a ceramic capacitor?

As the name suggests the ceramic capacitor is a type of non-polar capacitor in which the dielectric used is a ceramic material. It is made of two layers of metal (usually nickel and copper) with ceramic (Para electric or Ferroelectric) as the dielectric. These alternating layers are stacked together to provide high capacitance value.

Why are ceramic capacitors popular?

Ceramic capacitors are cheap, reliable, and perform very well, making them popular. They are also available in a wide range of capacitances and voltage ratings. Modern ceramic capacitors are fabricated in bulk, allowing them to have anywhere from one to many thousands of layers.

Do ceramic capacitors have a 3 digit code?

Ceramic capacitors have a three digit code, rather than the actual capacitance value listed. You can use this ceramic capacitor value calculator to calculate the actual value of your, or use the ceramic capacitor code calculator to convert the capacitance value into a code! Ceramic capacitors are tiny!

Ceramic Capacitors Knowledge. A ceramic capacitor is a two-terminal, non-polar device. The classical ceramic capacitor is the "disc capacitor". This device pre-dates the transistor and was used extensively in vacuum-tube equipment (e.g., radio receivers) from c.a 1930 through the 1950s, and in discrete transistor equipment from the 1950s through the 1980s.

In circuits where a small size of capacitor is required Ceramic capacitors come into picture. These were initially developed in Germany as replacement for mica. Before 1920's due to insulating properties of mica it was used as a dielectric material in a capacitor. Later, as there was shortage for mica a paraelectric titanium oxide was used as a dielectric ...
