

# Ceramic capacitors doped with rare earth

What are the advantages of REE dopants in ceramic capacitors?

The advantages of REE dopants in ceramic capacitors make REEs some of the most critical elements in the electronics industry. Given the shortages in the supply of REEs, the prices of REEs will climb significantly.

Why are ceramic capacitors doped with Rees?

All these capacitors are doped with REEs of intermediate ionic radii (such as Dy, Ho, and Er), since they improve the operating life (reliability) and electrical properties of the ceramic capacitors. The improvements in electric properties are a lower dissipation factor, lower aging rate, and a stable capacitance over a wide temperature range.

Does rare earth doped Batio 3 affect MLCC performance?

The defect mechanisms of rare earth (RE) doped BaTiO<sub>3</sub> have a strong impact on the electrical performance of the multilayer ceramic capacitors (MLCCs). Oxygen vacancy is the main reason for the device degradation over longtime use, while the effect of the doping strategy on controlling the oxygen vacancies is not yet quantitatively understood.

What are ceramic capacitors?

Ceramic capacitors are an indispensable component in electronic circuits, since they are used in various applications such as timing, filtering, and decoupling. These capacitors are doped with REEs that improve their operating life and electrical properties.

What is the economics of rare earth elements (REEs)?

In this paper, the economics of rare earth elements (REEs) are reviewed in light of their importance in ceramic capacitors. The developing rare earth element supply and demand crisis that can negatively impact the ceramic capacitor industry and, hence, the global economy, is explained.

What are rare earth-doped Batio 3 materials?

Rare earth (RE)-doped BaTiO<sub>3</sub> materials are promising dielectric materials for base-metal electrode multilayer ceramic capacitors (BME-MLCCs). Thus, the fundamental understanding of their effect on dielectric properties and reliability is crucial for further improvement of its performance.

The aqueous chemical coating route is highly effective in preparing BaTiO<sub>3</sub> nanoparticles uniformly coated with additives. Such nanoparticles can be used to produce nano-grained temperature stable BaTiO<sub>3</sub> ceramics with core-shell structure, fulfilling the need of next-generation ultrathin layer base metal electrode (BME) multilayer ceramic capacitors (MLCCs). ...

In this paper, the economics of rare earth elements (REEs) are reviewed in light of their importance in ceramic capacitors. The developing rare earth element supply and demand crisis that can negatively impact the ...

Doped barium titanate ( $\text{BaTiO}_3$ , BT) with rare-earth elements (REE) is used as dielectric in the manufacture of multilayer ceramic capacitors (MLCCs). The most common REE oxide employed as...

1.1 Rare-earth-doped  $\text{BaTiO}_3$ -based MLCCs Multilayer ceramic capacitors (MLCCs) are an important component in the market of modern electronics, such as computing, automotive and aerospace. Increasing demands in that market has led to the need for development of high performance MLCCs, with

Doped barium titanate ( $\text{BaTiO}_3$ , BT) with rare-earth elements (REE) is used as dielectric in the manufacture of multilayer ceramic capacitors (MLCCs). The most common REE oxide employed as dopant in... Journal of Materials Science: Materials in...

The defect mechanisms of rare earth (RE) doped  $\text{BaTiO}_3$  have a strong impact on the electrical performance of the multilayer ceramics capacitors (MLCCs). Oxygen vacancy is the main reason for the device ...

Doped barium titanate ( $\text{BaTiO}_3$ , BT) with rare-earth elements (REE) is used as dielectric in the manufacture of multilayer ceramic capacitors (MLCCs). The most common REE oxide ...

In this paper, the economics of rare earth elements (REEs) are reviewed in light of their importance in ceramic capacitors. The developing rare earth element supply and demand crisis...

The defect mechanisms of rare earth (RE) doped  $\text{BaTiO}_3$  have a strong impact on the electrical performance of the multilayer ceramics capacitors (MLCCs). Oxygen vacancy is the main reason for the device degradation over longtime use, while the effect of the doping strategy on controlling the oxygen vacancies is not yet quantitatively ...

Rare earth (RE)-doped  $\text{BaTiO}_3$  materials are promising dielectric materials for base-metal electrode multilayer ceramic capacitors (BME-MLCCs). Thus, the fundamental ...

The use of electronic devices that incorporate multilayer ceramic capacitors (MLCCs) is on the rise, requiring materials with good electrical properties and a narrow band gap. This study synthesized yttrium-substituted barium titanate ( $\text{Ba}_{1-x}\text{Y}_x\text{TiO}_3$ , BYT) using a sol-gel process at  $950 \pm 176^\circ\text{C}$  with varying concentrations of yttrium ( $0 \leq x \leq 0.3$ ). X-ray diffraction analysis showed ...

This work lays a foundation for the study of electrical properties of rare-earth doped ferroelectric ceramics and broadens the potential application of BCTH:  $x\%\text{Pr}^{3+}$  ceramics in electrical field.

The five types of rare earth oxides are introduced as dopants into  $\text{Ba}_{0.98}\text{Ca}_{0.02}\text{Ti}_{0.94}\text{Sn}_{0.04}\text{Zr}_{0.02}$  (BCTSZ) ceramics using the conventional solid-state approach. This leads to the fabrication of lead-free piezoelectric ceramics denoted as  $(1-x) (\text{Ba}_{0.98}\text{Ca}_{0.02}\text{Ti}_{0.94}\text{Sn}_{0.04}\text{Zr}_{0.02})_x\text{M}_2\text{O}_3$  ( $0 \text{ mol}\% \leq x \leq 0.12 \text{ mol}\%$ ,  $\text{M} = \text{La}, \text{Ce}, \text{Pr}, \text{Nd}, \dots$

## Ceramic capacitors doped with rare earth

The effects of rare-earth oxides, e.g., La, Nd, Sm, Dy and Yb, on the reliability of multilayer capacitors (MLCs) with X7R dielectrics and Ni electrodes were investigated. Microstructures of the ... Expand

Rare-earth-doped barium titanate (BaTiO<sub>3</sub>) ceramics with a perovskite structure are widely applied in multilayer ceramic capacitors (MLCC) [1]. When double rare earths are used as co-dopants in ...

The effects of rare-earth oxides, e.g., La, Nd, Sm, Dy and Yb, on the reliability of multilayer capacitors (MLCs) with X7R dielectrics and Ni electrodes were investigated. ...
