

# Desulfurization method of lithium iron phosphate battery

How to extract lithium from lithium iron phosphate batteries?

Valuable metals have been efficiently recovered from spent lithium iron phosphate batteries by employing a process involving via iron sulfate roasting, selective leaching, and stepwise chemical precipitation. This study proposes the selective extraction of lithium from  $\text{LiFePO}_4$  using the iron sulfate roasting-leaching method.

Can lithium iron phosphate batteries be recycled?

The lithium was selectively leached to achieve the separation of lithium and iron. The use of salt as a leaching agent can be recycled in the recycling process. More and more lithium iron phosphate ( $\text{LiFePO}_4$ , LFP) batteries are discarded, and it is of great significance to develop a green and efficient recycling method for spent  $\text{LiFePO}_4$  cathode.

How to recover lithium iron phosphate batteries?

At present, hydrometallurgy stands out as the prevailing method for recovering spent lithium iron phosphate batteries. Conventional hydrometallurgy techniques entail extracting  $\text{LiFePO}_4$  powder through leaching with strong acid solutions like  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$ .

Is lithium iron phosphate dissolved?

This chemical reaction is analogous to the lithium deintercalation process observed during the charging and discharging cycles of  $\text{LiFePO}_4$  batteries. The SEM pictures further confirmed that lithium iron phosphate was not completely dissolved, but transformed in-situ into iron phosphate, with lithium leaching into the DES.

Can sulfated-water leaching recover valuable metals from spent lithium-ion batteries?

Sun M et al (2019) Study on recovery of valuable metals from spent lithium-ion batteries. *Nonferrous Metall* (Extract Metall) 3:68-72 Zhang X, Wang H, Li Z et al (2022) New process of sulfated-water leaching for treating electrode material of spent lithium iron phosphate batteries.

Can lithium iron phosphate be used as raw materials?

The recovered  $\text{Li}_2\text{CO}_3$  and  $\text{FePO}_4$  can be used as raw materials for producing lithium iron phosphate. The process route is short and efficient with almost no wastewater and solid waste, which provides a new method for the recovery of waste LFP batteries.

Valuable metals have been efficiently recovered from spent lithium iron phosphate batteries by employing a process involving via iron sulfate roasting, selective leaching, and stepwise chemical precipitation. This study proposes the selective extraction of lithium from  $\text{LiFePO}_4$  using the iron sulfate roasting-leaching method. The ...

More and more lithium iron phosphate ( $\text{LiFePO}_4$ , LFP) batteries are discarded, and it is of great significance

# Desulfurization method of lithium iron phosphate battery

to develop a green and efficient recycling method for spent LiFePO<sub>4</sub> cathode.

At present, hydrometallurgy stands out as the prevailing method for recovering spent lithium iron phosphate batteries [3], [4]. Conventional hydrometallurgy techniques entail extracting LiFePO<sub>4</sub> ...

New energy vehicle batteries include Li cobalt acid battery, Li-iron phosphate battery, nickel-metal hydride battery, and three lithium batteries. Untreated waste batteries will have a serious ...

If you've recently purchased or are researching lithium iron phosphate batteries (referred to lithium or LiFePO<sub>4</sub> in this blog), you know they provide more cycles, an even distribution of power delivery, and weigh less than a comparable sealed lead acid (SLA) battery. Did you know they can also charge four times faster than SLA? But exactly ...

Lithium-iron-phosphate battery behaviors can be affected by ambient temperature, and accurately simulating the battery characteristics under a wide range of ambient temperatures is a significant challenge. A lithium-iron-phosphate battery was modeled and simulated based on an electrochemical model-which incorporates the solid- and liquid-phase ...

In this paper the most recent advances in lithium iron phosphate batteries recycling are presented. After discharging operations and safe dismantling and pretreat-ments, the recovery of...

Download scientific diagram | Electrochemical reactions of a lithium iron phosphate (LFP) battery. from publication: Comparative Study of Equivalent Circuit Models Performance in Four Common ...

Herein, an effective pyroprocessing-based strategy was proposed to recycle spent lithium iron phosphate (LFP) materials, featuring full element regeneration and conversion of high-value products. Specifically, over 99% Li was extracted and converted into high purity lithium carbonate (>99%), while Fe and P were further converted into value ...

With the new round of technology revolution and lithium-ion batteries decommissioning tide, how to efficiently recover the valuable metals in the massively spent lithium iron phosphate batteries and regenerate cathode materials has become a critical problem of solid waste reuse in the new energy industry. In this paper, we review the hazards and value of ...

The sustainable development of lithium iron phosphate (LFP) batteries calls for efficient recycling technologies for spent LFP (SLFP). Even for the advanced direct material ...

2 ???&#0183; After continuous optimization of all conditions, an efficient leaching of 99.5% Li was achieved, with almost all (>99%) Fe and Al impurities separated as precipitates. Lithium in the ...

# Desulfurization method of lithium iron phosphate battery

Using high-iron-containing desulphurization slag as raw materials, ferrous sulfates with the high purity of 99.0% were prepared by microwave-assisted acid leaching. ...

Lithium-iron phosphate (LFP) batteries have a lower cost and a longer life than ternary lithium-ion batteries and are widely used in EVs. Because the retirement standard is that the capacity decreases to 80 % of the initial value, retired LFP batteries can still be incorporated into echelon utilization [3] .

Using high-iron-containing desulphurization slag as raw materials, ferrous sulfates with the high purity of 99.0% were prepared by microwave-assisted acid leaching. Ferrous oxalates were...

2 ???&#0183; After continuous optimization of all conditions, an efficient leaching of 99.5% Li was achieved, with almost all (>99%) Fe and Al impurities separated as precipitates. Lithium in the leachate was precipitated as  $\text{Li}_2\text{CO}_3$  by adding  $\text{Na}_2\text{CO}_3$  at 95 °C, achieving a purity of 99.2%. A magnetic separation scheme is presented to successfully separate ...
