

Does battery technology have a big impact on the world

Are batteries the future of sustainable travel?

Advances in battery technology have made batteries a key component for the sustainable travel of the future. The energy stored in these batteries on wheels can be used to actually power your home and to help stabilise the grid.

Are lithium-ion batteries the future of energy storage?

As the world increasingly swaps fossil fuel power for emissions-free electrification, batteries are becoming a vital storage tool to facilitate the energy transition. Lithium-Ion batteries first appeared commercially in the early 1990s and are now the go-to choice to power everything from mobile phones to electric vehicles and drones.

Will battery recycling capacity increase in 2030?

While the supply of both battery scrap and retired EVs will increase, current expansion plans and outlooks suggest that battery recycling capacity could be in significant overcapacity in 2030: total supply in 2030 could account for only one-third of the announced recycling capacity in the STEPS and APS.

How many TWh of batteries will be produced in 2030?

When assuming a maximum utilisation rate of 85%, this translates to the potential for almost 8 TWh of batteries to be produced in 2030, of which over 5.5 TWh is from plants already operational today and those with committed announcements.

Are batteries safe?

I would say safety is priority number one for the industry. New technologies and better monitoring are making batteries a very safe way to store electricity. In an electric vehicle one battery cell might stop working, for example, but if it is designed safely it won't affect the whole vehicle.

Why are LFP batteries so popular in China?

This trend is driven mainly by the preferences of Chinese OEMs. Around 95% of the LFP batteries for electric LDVs went into vehicles produced in China, and BYD alone represents 50% of demand. Tesla accounted for 15%, and the share of LFP batteries used by Tesla increased from 20% in 2021 to 30% in 2022.
