Are battery energy storage systems causing noise?

Image: Wartsila. The noise of battery energy storage system (BESS) technology has "exploded" as a concern in the last six months, an executive from system integrator Wartsila ES&O said. BESS units primarily emit noise from their cooling systems, but balance of system (BOS) components like inverters and transformers also produce noise emissions.

Why does a Bess battery make a loud noise?

In our work with BESS, the noise is commonly associated with the battery and inverter modules' heating and cooling systems, with the use of fans and compressors being the main emitters. However, the noise levels emitted are highly variable and depend on several factors, including operating conditions, ambient temperatures, and speed drives.

How loud is a Bess cooling system?

Our field measurements show a wide range of noise levels generated by the cooling systems of BESS equipment. Noise levels tend to range from 70 to 92 decibels when measured 1 meter from the component. Key components and noise sources of a BESS facility include: Batteries: Rechargeable battery units are the core of the Battery Energy Storage System.

Why is noise a key environmental impact challenge?

Noise has emerged as a key environmental impact challenge in the development of BESS. But why? In our work with BESS, the noise is commonly associated with the battery and inverter modules' heating and cooling systems, with the use of fans and compressors being the main emitters.

How much noise can a battery fan make?

We also determined that the battery fan noise was tonal in character. This meant a tonal noise correction of 5 dBA would need to be applied to the City's noise limit and therefore a noise limit of 40 dBA would apply at the residences if the tone could not be removed.

What are the key components and noise sources of a Bess facility?

Key components and noise sources of a BESS facility include: Batteries: Rechargeable battery units are the core of the Battery Energy Storage System. Battery units (often 20 ft. in length and 8 ft in width and height) include cooling systems to maintain optimal operating temperature.

Essential to the steady, reliable supply of electricity from source to plug, Battery Energy Storage Systems (BESS) seem to be popping up everywhere- a trend that will continue. These sites may not seem noisy, but that is likely because detailed analyses were conducted to minimize sound level impacts at sensitive receptors. If not considered ...

During charging, inverters convert AC back to DC. This process generates heat, requiring cooling, typically with fans, which also produce noise. The switching process creates noise at frequencies like 120Hz or 100Hz and their harmonics, often heard as a hum. Transformers have three noise sources: core noise, coil noise, and fan noise. Some ...

Battery containers generally make little noise during normal operation when external ambient air temperatures are in the 5°C to 25°C range. Outside this range, greater ...

The primary cause of noise in BESS is internal cooling mechanisms -- namely fans -- which are needed to prevent overheating and internal failure. Battery cells generate significant heat when charging or discharging, making it critical that systems have a way to vent and reduce hot temperatures. Fans are vital to any BESS despite the noise, as ...

Effective BESS noise reduction can be achieved with the inclusion of sound barriers and sound walls. Incorporating a BESS helps stabilize the energy supply to the grid and improve system voltage during times of high demand. It helps reduce power loss in the transmission network and can store excess renewable energy that would normally be curtailed.
