

What is a charging pile?

A charging pile, also commonly referred to as an electric vehicle charging station or charging point, is a specialized piece of infrastructure designed to supply electric energy for recharging electric vehicles.

What is the installation distance of the charging pile?

The minimum installation distances for the charging pile are: no less than 700 mm from the back door to the wall, and no less than 500 mm from the side face to the wall. (5) The canopy is built together with the charging pile. (6) This installation method is just a sample for reference.

Why is it important to maintain the charging pile?

The importance of maintaining charging piles lies in the fact that influences by the changeable environment and ageing inner parts can cause various faults. Regular examination and maintenance are necessary during both product storage and using processes.

How do I set up the Charging Pile?

To set up the Charging Pile, follow these instructions: Enter the system menu page by clicking 'system' at the bottom left of the homepage. A username and password dialog will appear. Use the following credentials: Username: USER, Password: 4567. Click 'OK' to enter the system setting page.

How to check the temperature of charging pile?

To check the temperature of a charging pile, click on 'temp. displaying' at the system menu page (see figure 9.3.2.2). This will display the real-time temperature of the charging pile inlet/outlet and DC+/DC- of all vehicle connectors.

What is the difference between charging pile and charging stations?

1. Charging pile refers to a charging device with a charging gun and a human-machine interface, which is simply an electrical device that can be charged, either in one piece or in a split type.

Fig. 13 compares the evolution of the energy storage rate during the first charging phase. The energy storage rate q_{sto} per unit pile length is calculated using the equation below: $(3) q_{sto} = m \cdot c_w \cdot (T_{in\ pile} - T_{out\ pile}) / L$ where m is the mass flowrate of the circulating water; c_w is the specific heat capacity of water; L is the length of energy pile; $T_{in\ pile}$ and $T_{out\ pile}$...
