## SOLAR PRO.

## Field promotion of solar cells

How DSSC can be used in photovoltaic cell field?

Providing a universal way that can be available in photovoltaic cell field by non-contact external magnetic field modulation method. In dye-sensitized solar cells (DSSCs), the light absorbance of photoanode is the most important factor in power conversion efficiency (PCE).

Can front surface field be used in perovskite photovoltaics?

We investigated the viability of incorporating the "front surface field" concept into perovskite photovoltaics. We utilized the energy band alignment optimization owing to front surface field. The n-type buffer layer can optimize the interfacial contact, passivate defects and reduce the open-circuit voltage loss.

Is a magnetic field a donor-acceptor model for organic photovoltaic cells?

Here we propose a donor-acceptor model for a generic organic photovoltaic cell in which the process of charge separation is modulated by a magnetic field which tunes the energy levels. The impact of a magnetic field is to intensify the generation of charge transfer states with triplet character via inter-system crossing.

What is front surface field in n-i-p photovoltaics?

For n-i-p devices, the film quality of perovskites is further influenced by the characteristics of the interface between the electron transport layer (ETL) and perovskite layer. Herein, we introduce a "front surface field" based on the concept of back surface field (BSF) technique into perovskite photovoltaics.

What is back surface field technology in crystalline silicon solar cells?

In crystalline silicon solar cells,back surface field (BSF) technology is deftly employed to alter the energy band configuration and enhance interface contact,hence optimizing carrier extraction and transmission and resulting in high open-circuit voltage (VOC) and excellent photoelectric conversion efficiency ,,,.

Does a magnetic field affect organic solar cells?

Previous studies of the effect that a magnetic field has in organic solar cells are based on long time (u s) OPV dynamic models, with mostly negative magnetic field effects in photocurrent generation 11,30.

Specifically engineered three-dimensional (3D) and 1D morphologies are expected to play significant roles in the development of next-generation dye-sensitized solar ...

Although the macroscopic effect of applying the magnetic field is an increase in generated photocurrent, and therefore an increase in power conversion efficiency of the solar cell, its usefulness ...

Probing ionic conductivity and electric field screening in perovskite solar cells: a novel exploration through ion drift currents+. Matthias Diethelm \* a, Tino Lukas a, Joel Smith a, Akash Dasgupta a, Pietro Caprioglio a, Moritz Futscher b, Roland Hany c and Henry J. Snaith \* a a Department of Physics, University of Oxford,

## Field promotion of solar cells

Clarendon Laboratory, Oxford OX1 3PU, UK.

Here we propose a donor-acceptor model for a generic organic photovoltaic cell in which the process of charge separation is modulated by a magnetic field which tunes the energy levels. The...

Chen, W. et al. High-polarizability organic ferroelectric materials doping for enhancing the built-in electric field of perovskite solar cells realizing efficiency over 24%. Adv. Mater. ...

Photovoltaics and its magnetic-field promotion effect in dye-sensitized solar cells with BiFeO3 + TiO2 composite photoanodes

Specifically engineered three-dimensional (3D) and 1D morphologies are expected to play significant roles in the development of next-generation dye-sensitized solar cells. In this study, using a ... Expand

Crystalline silicon solar cell (c-Si) based technology has been recognized as the only environment-friendly viable solution to replace traditional energy sources for power generation.

We investigated the viability of incorporating the "front surface field" concept into perovskite photovoltaics. We utilized the energy band alignment optimization owing to front surface field. The n-type buffer layer can optimize the interfacial contact, passivate defects and reduce the open-circuit voltage loss.

In dye-sensitized solar cells (DSSCs), the light absorbance of photoanode is the most important factor in power conversion efficiency (PCE). Here the authors report on an alternative modified...

Carbon-based all-inorganic cesium lead bromide (CsPbBr3) halide perovskite solar cells (PSCs) have attracted tremendous attention owing to their low cost, simplified preparation, and outstanding stability even under harsh conditions. However, CsPbBr3 perovskite always suffers from an undesirable crystallization and film morphology with incomplete coverage and ...

Providing a universal way that can be available in photovoltaic cell field by non-contact external magnetic field modulation method. In dye-sensitized solar cells (DSSCs), the light absorbance of photoanode is the most important factor in power conversion efficiency (PCE).

This study focuses on the promotion of electron transfer in microbial fuel cells (MFCs) by equipping a silicon solar cell (SSC) into the circuit. As compared to a sole MFC, a significant improvement of power output is observed in the MFC-SSC, that the maximum power density increases from 7.5 W m -3 -19 W m -3 by 2.53 times. A linear relationship between ...

We investigated the viability of incorporating the "front surface field" concept into perovskite photovoltaics. We utilized the energy band alignment optimization owing to front ...

## Field promotion of solar cells

In this work, a strategy is proposed to break constraints on the application of the staggered bilayer ETL in high-efficiency PSC, namely utilizing a built-in field to overcome the ...

Wide bandgap (WBG) perovskites, with an adjustable bandgap and easy solution fabrication process, are prime candidates for top sub-cells in tandem solar cells (TSCs). Their successful integration with narrow bandgap devices has inspired the rapid development of perovskite-based TSCs and has become one of the
