Does hybrid heat dissipation improve the thermal management performance of a charging pile?

Ming et al. (2022) illustrates the thermal management performance of the charging pile using the fin and ultra-thin heat pipes, and the hybrid heat dissipation system effectively increases the temperature uniformity of the charging module.

Can UTHPs be used to heat dissipate DC EV charging piles?

The UTHP was especially suitable for the heat dissipation of electronic equipment in narrow space. Thus it could be directly attached to the surface of the electronic components to cool the heat source. However, few researches reported on the application of UTHPs to the heat dissipation of the DC EV charging piles. Fig. 1.

Can ultra-thin heat pipes reduce the operation temperature of a charging pile?

In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat pipes (UTHPs) hybrid heat dissipation system for the direct-current (DC) charging pile. The L-shaped ultra-thin flattened heat pipe with ultra-high thermal conductivity was adopted to reduce the spreading thermal resistance.

How does heat dissipation work in EV charging piles?

Electric vehicle charging piles employ several common heat dissipation methods to effectively manage the heat generated during the charging process. These methods include: 1. Air Cooling: Air cooling is one of the simplest and most commonly used methods for heat dissipation in EV charging piles.

How much heat does a fast charging pile use?

The heat power of the fast charging piles is recognized as a key factor for the efficient design of the thermal management system. At present, the typical high-power direct current EV charging pile available in the market is about 150 kW with a heat generation power from 60 W to 120 W (Ye et al., 2021).

Why did EV charging piles become a 'gas station'?

The construction of the charging pile, which was called as the 'gas station' of EV, developed rapidly. The charging speed of the charging piles was shortened rapidly, which was a challenge for the heat dissipation system of the charging pile.

Heat dissipation area of electric energy storage charging pile

The results showed that the energy loss increases with the increase of charging current, and the heat loss accounts for more than 85% of the total energy loss. In addition, the total heat generation during the charging and discharging process of the SCs are greater than the Joule heat generation. The difference is partly caused by the irreversible Faraday reaction ...
