

How to view battery capacity and charging current

How do I know if a battery has a full charge capacity?

Scroll down to see the Design and Full Charge Capacity fields, along with the Cycle Count number. The Design Capacity is the amount of mWh that the battery should have had when it was brand new and the Full Charge Capacity is the amount that it can hold now when at 100 percent charge.

What is the full charge capacity of a battery?

The full charge capacity is nothing but the current storage capacity of the battery. If you scroll down the page, you will see a section called Battery capacity history. The table shows how your battery's storage capacity has declined over time. The full charge capacity of the battery will be close to the design capacity when its new.

How do I determine the battery capacity of my laptop?

When it comes to determining the battery capacity of your laptop, one of the most reliable sources of information is the manufacturer's website. Here's how you can navigate through the site to find what you need: Start by finding the official website of the laptop's brand. Look for a section related to product specifications or technical details.

How do I know if my battery is charging?

Open it with your web browser. Analyze: Look for the "Design Capacity" and "Full Charge Capacity" to see if the battery is holding its original charge. Additionally, check the "Recent Usage" section for charge/discharge rates. BatteryInfoView: A free utility showing detailed charging/discharging information.

What is battery capacity?

Battery capacity is measured in milliampere hours (mAh) or watt-hours (Wh). Two key terms are: Full charge capacity: the amount of energy the battery can hold currently. Design capacity: the original energy capacity of the battery. To check these, you can use an app like BatteryInfoView.

How can I compare my laptop's battery capacity?

Hopefully, you remember that amp hours are a measure of electric charge Q (the battery capacity). Hence, the final version of the battery capacity formula looks like this: $E = V \times Q$, where: E - Energy stored in a battery, expressed in watt-hours; V - Voltage of the battery; and; Q - Battery capacity, measured in amp-hours.

The charging rate depends very much on the battery's chemistry - Lead-acid, Ni-Cad, NiMh, Lithium-ion, etc. The maximum charge rate for wet cell lead acid battery is about 10% To 15% of the amp hour rating and 30% for Lithium-ion batteries. Suppose you have 12v 120 Ah battery (assuming it's lead-acid) should be charged at 12 to 24 Amps max.

The displayed battery information includes the battery name, manufacture name, serial number, manufacture date, power state (charging/discharging), current battery capacity, full charged capacity, voltage, charge/discharge rate, and more...

The basic formula for calculating the capacity of a battery is to multiply the voltage by the current and then by the time. The formula is as follows: $\text{Capacity} = \text{Voltage} \times \text{Current} \times \text{Time}$ Where: Capacity is the battery's capacity in ampere-hours (Ah). Voltage is the battery's voltage in volts (V). Current is the battery's
