What is capacity configuration optimization model of industrial load and energy storage system? Capacity configuration optimization model of industrial load and energy storage system Considering the tough environment, two ESSs are compared to analysis their annual economic profitability. In addition, the proposed optimization accounts for the discount rate of fund flow. 3.1. Objective function

What is the planning model for industrial and commercial user-side energy storage?

Based on this, a planning model of industrial and commercial user-side energy storage considering uncertainty and multi-market joint operation is proposed. Firstly, the total cost of the user-side energy storage system in the whole life cycle is taken as the upper-layer objective function, including investment cost, operation, and maintenance cost.

What is the control strategy of industrial load and energy storage system?

The control strategy of ESS is following the two-fold: u AA. 3. Capacity configuration optimization modelof industrial load and energy storage system Considering the tough environment, two ESSs are compared to analysis their annual economic profitability. In addition, the proposed optimization accounts for the discount rate of fund flow.

How to plan industrial and commercial user-side energy storage (ICUs-es)?

When planning the industrial and commercial user-side energy storage (ICUS-ES) system, it is necessary to comprehensively consider the economy and environment of the system. Thus, it can ensure that the planning results of industrial and commercial user-side energy storage are more in line with the actual situation.

What is energy storage?

Energy storage, as a "buffer" between the uncertainty of power generation and the disorder of load use in the Energy Internet, is its key supporting technology. Unlike the large-scale centralized energy storage on the power supply side and the grid side, distributed energy storage is usually installed on the user side or in the microgrid.

How to plan the energy storage system on the user side?

For the planning of the energy storage system on the user side, the main problems are: Li D et al. [9] consider the annual comprehensive cost of installing the energy storage system and the daily electricity charge of users and establish a two-level optimization model.
