With their small size, lightweight, high-temperature performance, fast recharge rate and longer life, the lithium-ion battery has gradually replaced the traditional lead-acid battery as a better option for widespread use in the communication energy storage system and more industrial fields.

Do not keep the battery charged at 100%: Just like draining the battery to 0%, keeping it permanently charged at 100% is very harmful. Over time, this will increase its internal resistance and reduce its capacity. It is advised when removing the battery for storage to keep it between 30% and 40% of its capacity, as this allows it to be preserved best.

Nickel-cadmium (NiCd) batteries have carved out a niche in telecom systems due to their durability and reliability. They perform well under extreme temperatures, making them suitable for various environments where other battery types might falter. One of the key benefits is their ability to handle rapid charging cycles.
