What is the difference between lithium ion battery prices and nickel prices?

Data until March 2023. Lithium-ion battery prices (including the pack and cell) represent the global volume-weighted average across all sectors. Nickel prices are based on the London Metal Exchange, used here as a proxy for global pricing, although most nickel trade takes place through direct contracts between producers and consumers.

Why do lithium ion batteries cost so much?

Lithium-ion batteries require specific raw materials like lithium, cobalt, nickel, and graphite. Fluctuations in the prices of these materials impact battery costs. For instance, cobalt's limited supply and geopolitical challenges have led to price volatility. Related:

Get up-to-speed with our battery raw material prices, news, trends and forecasts. The price of lithium is falling, but some Western companies have recently announced more investments in the Lithium Triangle - a region of South America comprising parts of Argentina, Chile and Bolivia.

Will lithium supply slow the decline in battery prices?

But while the lithium supply could slow the decline in battery prices over the next few years, the long-term outlook is still positive. Experts say that by 2030, batteries will cost about half of the \$140/kWh average price in 2020.

What will happen to the lithium price in 2021?

The result has been that the price of battery-grade lithium carbonate in November 2021 was more than five times that of November 2020. Due to the terms of most supplier contracts, the impact of the high demand and low supply for lithium in the second half of this year may not be felt until early 2022.

Could rising battery prices reverse the downward trend?

The rising price of materials like lithium, cobalt, and nickel could actually reverse the downward trend in battery prices. BYD, the second-largest battery maker in China, announced a 20% price increase for its batteries in November, citing the limited supply of raw materials.
