What is a lead acid battery?

Battery types Lead-acid batteries are one of the oldest and most widely used battery types. They consist of lead plates immersed in an electrolyte solution of sulfuric acid. Typical applications for these batteries include automobiles, uninterruptible power supplies (UPS), and other systems that demand reliable energy storage.

What is a lead-acid battery?

Complete List of Battery Terms, Definitions, and Glossary by Clarios. Acid: A type of chemical that can release hydrogen ions when mixed with water. Sulfuric acid is used in a lead-acid battery. Active Material: The porous structure of lead compounds that produces and stores electrical energy within a lead-acid battery.

What is a valve regulated lead acid battery?

Valve Regulated Lead Acid (VRLA) Battery A Valve Regulated Lead Acid (VRLA) battery is a sealed lead-acid battery with a built-in pressure relief valve. The valve allows the battery to release excess gas pressure, which may build up during charging, and prevents overpressure-related damage. VRLA batteries include AGM and gel batteries.

What are the characteristics of a sealed lead-acid battery?

Sealed lead-acid battery, generally having the following characteristics: Maintenance-free and leak-proof. Batteries of this type have a safety vent to release gas in case of excessive internal pressure build-up. Hence also the term: Valve regulated battery or VRLA.

What is a lithium ion battery?

A lithium-ion battery is a type of rechargeable battery that relies on the movement of lithium ions between the anode and cathode for energy storage and release. Lithium titanate is a type of anode material for lithium-ion batteries. It has high power density, long cycle life, and good safety.

What is an anode in a battery?

An anode is the electrode in a battery where oxidation occurs, releasing electrons to the external circuit. When a device is powered, the anode carries a positive charge. But when the device is discharging, and power is being removed, the anode assumes a negative charge.

VALVE REGULATED LEAD-ACID BATTERY (VRLA BATTERY) -- A battery constructed with a fully enclosed case venting system sealed with a 1-way valve, under pressure above ...

The battery in which acid is used as electrolyte, e.g., lead-acid battery in which sulfuric acid is the electrolyte. Electrode material which produces electrical energy during discharge from chemical energy stored during charge. A battery which ...

Lead-acid batteries are one of the oldest types of rechargeable batteries, invented in 1859 by Gaston Planté. They have a typical cycle life of 500 to 1000 charge-discharge cycles, depending on usage and maintenance. The efficiency of lead-acid batteries is usually around ...

rounding lead-acid batteries is related to the adverse health and environmental effects of lead (11). More effective mitiga-tion is feasible with application of known practices, strict gov-ernment regulations, and im-proved training and engineering controls, which would further increase the already impressive recycling rate of 99% (12). Also, many serious safety and health concerns ...

VALVE REGULATED LEAD-ACID BATTERY (VRLA BATTERY) -- A battery constructed with a fully enclosed case venting system sealed with a 1-way valve, under pressure above atmospheric, where venting of gasses is regulated through the valve that operates in a normally closed position. This configuration enables an oxygen charge shuttle reaction (recombination) inside the ...

Lead-Acid Battery: Battery made up of plates, lead and lead oxide (various other elements are used to change density, hardness, porosity, etc.) with a 35 percent sulfuric acid and 65 percent water solution. This solution is called electrolyte, which causes a ...

Lead-acid battery related terms

Check out our lead-acid battery glossary to learn about the technical terms related with this battery technology. The electrolyte in a battery is absorbed in an Absorbent Glass Mat between the plates to ensure that there is no free liquid electrolyte to spill or leak from the cell.

Primary Battery: A battery or battery pack that can only be discharged once and cannot be recharged. Examples include alkaline manganese-zinc batteries. Secondary Battery: A battery in which the process is reversible so that it can be charged and discharged repeatedly. Examples include lead-acid batteries.

SLA Battery. Sealed lead-acid battery, generally having the following characteristics: Maintenance-free and leak-proof. Batteries of this type have a safety vent to release gas in case of excessive internal pressure build-up. Hence also the term: Valve regulated battery or VRLA.

An SLI (Starting, Lighting, and Ignition) battery is a lead-acid battery used in vehicles to start the engine and power the lights and other electrical components. It has low internal resistance and delivers maximum current quickly to keep the voltage constant, making it essential for the starter motor, lighting, and ignition system.
