How long do perovskite solar cells last?

By the team's estimate, perovskite solar cells made with this capping layer could last up to 30 years of outdoor operation, making it the first of its type to cross the commercial threshold of a 20-year lifetime. The researchers calculated this lifespan using a new accelerated aging technique they developed to test the durability of solar cells.

How stable are metal halide perovskite solar cells?

1. Introduction With the power-conversion efficiencies (PCEs) of metal halide perovskite solar cells (PSCs) reaching 25.8% , long-term stability has become the next goal for commercialization.

Can accelerated aging make perovskite solar cells more durable?

The team says that not only does the study provide a new way to make more durable perovskite solar cells, but the accelerated aging technique will help scientists test the durability of all kinds of solar cells. The research was published in the journal Science.

Are perovskite solar cells a viable technology?

As an emerging photovoltaic (PV) technology, perovskite solar cells (PSCs) have attracted tremendous attention due to their advantages of high efficiency, low cost, simple fabrication process, etc. ,,. However, PSCs are still facing stability issues that hamper their commercialization,.

Are perovskites stable?

The problem, however, is that perovskites aren't very stable and tend to break down when exposed to the elements. Fixing that problem has been the focus of plenty of past work, with scientists experimenting with adding bulky molecules, old pigments or quantum dots.

How hot is a perovskite cooling system?

Actually, under 7.35 suns, the detected temperature of the device can easily reach  $>130$  °C if we withdraw the water and air cooling system. This high temperature will certainly accelerate the decomposition of perovskite, resulting in rapid degradation of PSCs ,.
