

Liquid cooling principle of energy storage charging pile

How does a liquid cooling rapid charger work?

Liquid cooling rapid chargers use liquid-cooled cables to help combat the high levels of heat associated with high charging speeds. The cooling takes place in the connector itself, sending coolant flowing through the cable and into the contact between the car and the connector.

What are liquid cooled charging cables?

Liquid cooled charging cables can use thinner-gauge wire and reduce cable weight by 40% and lighter-weight cables are easier for consumers to handle. Some technologies already offer liquid cooling that lowers the temperature in the charging cables and at the DC contacts at the vehicle's electrical connector.

Why is liquid cooling a logical next step?

Given the limitations of existing air-cooling solutions, liquid cooling is a logical next step for enabling efficient performance of onboard battery cells/packs, charging stations and other key EV components such as charging cables. All must be able to handle the heat as power increases.

What is liquid cooling & how does it work?

Liquid cooling allows the charging cables to be thinner and lighter, reducing the cable weight by around 40%. This makes them easier for the average consumer to use when charging their vehicle. Instead of fumbling around with thick and unwieldy cables, they can quickly connect the cable to their vehicle and watch as their battery rapidly charges.

Can a liquid cooling rapid charger charge an EV?

While the process of charging an EV may not be as fast as filling a tank of gas (yet!), it's becoming easier and faster than ever thanks to liquid cooling rapid chargers. Not only do liquid cooling rapid chargers have cables that are easier to handle, but they also help drivers charge their cars and head out on their way as quickly as possible.

How to optimize the temperature of a cooling system?

The temperature can be optimized by the device's water loop system. Mineral oils and water-glycol are among the fluids found in them. These coolants circulate through the cables, cooling them and regulating the temperature at the connections. The optimizing liquid cooling fluid includes fluid connectors that are well-designed.

Indirect liquid cooling is a heat dissipation process where the heat sources and liquid coolants contact indirectly. Water-cooled plates are usually welded or coated through thermal conductive silicone grease with the chip packaging shell, thereby taking away the heat generated by the chip through the circulated coolant [5].
