

What are rechargeable lithium-ion batteries?

Rechargeable lithium-ion batteries (LIBs) dominate the energy storage market in sectors ranging from portable electronics to electric vehicles. Research and development in battery chemistries alternative to Li-ion are also rapidly growing, considering the high cost and limited abundance of lithium.

Can overlithiated cathode materials supplement active lithium?

Overlithiated cathode materials can supplement active lithium without sacrificing the energy density and rate performance of the cell. However, considering the safety, cost, and service life, the existing energy storage batteries, especially ultra long-life energy storage batteries, are mainly based on the LFP cathode route.

What are lithium ion batteries used for?

Introduced new discoveries of cathode and anode materials in catalysts and other fields. Lithium-ion batteries (LIBs) are widely used in various aspects of human life and production due to their safety, convenience, and low cost, especially in the field of electric vehicles (EVs).

Why are lithium-ion batteries so popular?

Lithium-ion batteries (LIBs) are widely used in various aspects of human life and production due to their safety, convenience, and low cost, especially in the field of electric vehicles (EVs). Currently, the number of LIBs worldwide is growing exponentially, which also leads to an increase in discarded LIBs.

Can prelithiation reduce the energy density of a lithium ion battery?

At the same time, the irreversible lithium loss during the initial cycle will reduce the energy density of the battery, which can reduce the specific energy of the existing lithium-ion battery by about 5%-20%. To solve the problem, prelithiation technology has been studied.

What are the advantages of Lithium X Y?

When mixing with the existing mature system, it can significantly improve the energy density of the cell. Li x Y (Y = O, N, S) materials are considered to be the most commercial potential lithium-rich additives, and the lithium supplement capacity is generally $>1000 \text{ mAh g}^{-1}$.
