

# Lithium battery charging optimization

What are the optimization objectives of the lithium battery charging model?

The lithium battery charging model was constructed as two subsystems, electric and thermal. The optimization objectives of the electronic system include battery charging time and energy loss, and the optimization objectives of the thermal subsystem include the internal temperature rise and surface temperature rise of the battery.

How to optimize the multi-stage charging strategy of lithium-ion batteries?

Taking into account the two factors of charging time and charging temperature rise, the multi-stage charging strategy of the lithium-ion battery is optimized by the particle swarm optimization algorithm.

Why is fast charging of lithium-ion batteries important?

Fast charging of lithium-ion batteries is essential to alleviate range anxiety and accelerate the commercialization of electric vehicles. However, high charging currents seriously deteriorate battery life due to the danger of metallic lithium deposition on the anode and the accompanying degradation reactions.

How to charge a lithium ion battery?

The most widely used charging method for lithium-ion batteries is the traditional constant current-constant voltage charging. Although it combines the advantages of constant current charging and constant voltage charging methods, it does not meet the current demand for safe and fast charging in the field of lithium-ion batteries.

How to optimize battery charging strategy?

In consideration of battery charge polarization and temperature rise constraints, the optimized charging strategy can be summarized as follows. First, taking the acceptable charge current as the optimal charge current limit, the battery is charged with high current at the initial charging stage to speed up the charging process.

What is the optimal charging strategy for Li-ion batteries?

Min, H. et al. proposed an optimal charging strategy for Li-ion batteries based on the voltage-based multistage constant current (VMCC) charging strategy using a multi-objective particle swarm optimization (MOPSO) algorithm and analyzed the effects of different charging target numbers, charging cut-off voltages, and weighting factors.

Fast charging of lithium-ion batteries is essential to alleviate range anxiety and accelerate the commercialization of electric vehicles. However, high charging currents ...

Battery electric vehicles (BEVs) are advocated due to their environmental benign characteristic. However, the long charging time and the degradation caused by fast charging impede their further popularization. Extensive research has been carried out to optimize the charging process, such as minimizing charging time and aging, of

lithium-ion batteries ...

Fast charging of lithium-ion batteries is essential to alleviate range anxiety and accelerate the commercialization of electric vehicles. However, high charging currents seriously...

DOI: 10.1016/j.est.2024.110716 Corpus ID: 267444592; Lithium battery charging optimization via multi-stage combined charging strategy in solar-powered vehicles @article{Du2024LithiumBC, title={Lithium battery charging optimization via multi-stage combined charging strategy in solar-powered vehicles}, author={Yunhao Du and Zhicheng Zhang and Zhiqiang Zuo and Yijing ...

In this paper, a multi-stage constant current charging mode considering the temperature rise, health loss, and charging time is proposed. Based on the equivalent circuit model, thermal model and aging empirical model of the battery, the objective function of charging optimization is constructed.

Extensive research has been carried out to optimize the charging process, such as minimizing charging time and aging, of Lithium-ion Batteries (LIBs). Motivated by this, a comprehensive...

The increasing demand for high-performance energy storage solutions has brought lithium batteries to the focus of modern technology. The need for fast charging in portable electronics and electric vehicles requires innovative material and design methods. This review presents a thorough analysis of material design modelling aimed at improving the fast ...

In this paper, a multi-stage charging strategy is proposed from the solar irradiance constraints, which aims at improving charging efficiency and inhibiting battery aging. Subsequently, a weighted multi-optimization objective function incorporating charging anxiety and battery health is put forward.

Eq. (11) is used to calculate the temperature of the lithium-ion battery and input the battery temperature as a feedback value  $T_{fb}$  into the PID closed-loop thermostatic control system to realize the thermostatic control. If this closed-loop constant temperature strategy replaces the constant current (CC) part of the CC-CV charging strategy, the constant voltage ...

In this work, an electrochemical model-based fast charging protocol optimization for a lithium battery cell will be developed to minimize capacity fade due to the SEI increase and the lithium plating with charging-discharging cycles. An electrochemical-thermal-capacity fade coupled model will be developed to monitor battery ...

Taking into account the two factors of charging time and charging temperature rise, the multi-stage charging strategy of the lithium-ion battery is optimized by the particle swarm optimization algorithm. The experimental results show that the multi-stage constant current charging method proposed in this paper not only reduces the ...

# Lithium battery charging optimization

Extensive research has been carried out to optimize the charging process, such as minimizing charging time and aging, of lithium-ion batteries (LIBs). Motivated by this, a ...

Fast charging of lithium-ion batteries is essential to alleviate range anxiety and accelerate the commercialization of electric vehicles. However, high charging currents seriously deteriorate battery life due to the danger of metallic lithium deposition on the anode and the accompanying degradation reactions. In this work, a reduced ...

Lithium-ion batteries are ubiquitous in a wide range of applications including cellphones, laptops, automotive vehicles, and smart grids, due to high energy and power densities [1], [2]. As battery chemistries continue to advance, an important question concerns how to determine charging protocols that best balance the desire for fast charging while limiting ...

Lithium-Ion Battery Charging Schedule Optimization to Balance Battery Usage and Degradation Jacob Azoulay and Nico Carballal Stanford University AA222: Engineering Design Optimization jazoulay@stanford -- nicocarb@stanford Abstract This work optimizes a lithium-ion battery charging schedule while considering a joint revenue and battery degradation model. ...

Abstract: This paper applies advanced battery modeling and multiobjective constrained nonlinear optimization techniques to derive suitable charging patterns for lithium-ion batteries. Three important yet competing charging objectives, including battery health, charging time, and energy conversion efficiency, are taken into account ...
