

Does safety valve type affect thermal runaway and gas venting behavior of lithium-ion batteries?

The safety valve is an important component to ensure the safe operation of lithium-ion batteries (LIBs). However, the effect of safety valve type on the thermal runaway (TR) and gas venting behavior of LIBs, as well as the TR hazard severity of LIBs, are not known.

Which safety valve type affects the gas venting behavior of batteries?

(a) The battery with oval safety valve; (b) the battery with round safety valve; (c) the battery with cavity safety valve; (d) error analysis of the expansion force. Similarly, the safety valve type had a large influence on the gas venting behavior of the batteries.

What is the safety venting pressure of a lithium ion battery?

According to the manufacturer, the safety venting pressure of all three batteries was 1.2 MPa. The maximum expansion force of the three batteries was 9.63 \pm 1.15, 8.53 \pm 0.28 and 7.95 \pm 0.45 kN, respectively, which revealed that the expansion behaviors of three batteries were severe before the safety venting.

Why do LFP batteries have a cavity safety valve?

The cavity safety valve of Sample battery 3 # has a top cap, which impedes the instantaneous venting behavior and leads to a higher maximum expansion force during TR. Fig. 5. The expansion force and gas pressure variations of the LFP batteries with three types of safety valves.

Which safety valve is best for LFP battery?

The oval safety valve was therefore the most suitable for the substance emissions from the LFP battery amongst the three tested safety valves. The oval safety valve design can play an important role in preventing the accumulation of heat inside the LFP battery and the rupture of the battery shell during TR. 3.3.

Which safety valve types affect the gas venting whirl of the LFP battery?

The safety valve types affected the gas venting whirl of the LFP battery. For the LFP battery with an oval safety valve during TR, the gas venting whirl was less intense and not obvious. However, the gas venting whirl was the most distinct for the LFP battery with a round safety valve.
