What is Performance Characterization Testing for lithium-ion batteries?

Performance characterization testing provides health and performance features that can be used to assess a battery's performance and reliability under a variety of field environments and usage conditions. This paper presents and discusses the performance characterization tests for lithium-ion batteries in portable electronic applications.

How do you test a lithium battery?

IEC stipulates that the standard cycle life test of lithium batteries is: Step 1: Discharge the cell to 3.0V with the discharge rate at 0.2C and then charge to 4.2V with charging rate at 1C and constant current and constant voltage. The experiment requires that the cut-off current is 20mA. Want More Details: Download our battery design ebook.

What are the performance tests of lithium batteries?

The performance tests of lithium batteries include voltage, internal resistance, capacity, internal voltage, self-discharge rate, cycle life, sealing performance, safety performance, storage performance, appearance, etc. Performance test is up to 230 items. As well as overcharge, over discharge, weld-ability, corrosion resistance, etc.

What is the internal voltage test of lithium battery?

The internal voltage test of lithium battery is: (UL standard) The simulated battery is at an altitude of 15240m above sea level (low pressure 11.6kPa) to check whether the battery leaks or bulges.

What is a battery test?

These tests are performed to evaluate the responses of a battery subjected to real-life off-normal conditions and to assess the cell's behavior under extremely abusive conditions. They allow manufacturers to observe and identify potential battery weak points and vulnerabilities in real potential situations before being brought into the market.

What are the abuse tests for lithium-ion batteries?

The main abuse tests (e.g., overcharge, forced discharge, thermal heating, vibration) and their protocol are detailed. The safety of lithium-ion batteries (LiBs) is a major challenge in the development of large-scale applications of batteries in electric vehicles and energy storage systems.
