What happens when a lithium ion battery goes into sleep mode?

Lithium-ion batteries have a built-in protection mechanism that activates when the battery voltage drops to a certain level. This protection circuit turns off the battery to prevent damage. As a result, the battery goes into sleep mode. Can I wake a sleeping lithium-ion battery by charging it?

What is a sleeping lithium-ion battery?

A sleeping lithium-ion battery is essentially a battery that has discharged to a critically low level, causing it to enter a protection mode. This protection mode prevents any further discharge of the battery to avoid irreversible damage. When a lithium-ion battery is in this state, it becomes unresponsive and may not charge or turn on.

How to wake up a sleeping lithium-ion battery?

Connect the charger to your battery and set it to the boost charge mode. The charger will apply a high-current charge to your battery, which can help wake it up. If the basic recovery methods fail to wake up your sleeping lithium-ion battery, you may need to consider advanced recovery methods.

Can a lithium battery charger wake a sleeping battery?

Most lithium battery chargers cannot wake up a sleeping lithium battery. However, some smart lithium chargers, such as the Victron Blue Smart IP65 Charger, will 'force feed' a sleeping battery a low current until it wakes up, then resume normal charging.

Is a sleeping LiFePO4 battery dead?

A LiFePO4 battery reading an abnormally low voltage -- such as 5 volts or less -- has probably entered sleep mode, also called low voltage disconnect (LVD), to protect the cells from overdischarge. The good news is a sleeping lithium battery isn't dead. But act fast!

Can a 48V lithium battery be woke up?

Yes, it is possible to recover a 48v lithium battery that has entered sleep mode. The easiest way to wake your lithium-ion battery up after it has gone into sleep mode is to use a battery charger that includes a BOOST or WAKE UP feature built right in. Spent lithium-ion batteries (LIBs) contain various critical elements such as lithium (Li), cobalt (Co), and nickel (Ni), which are valuable feedstocks. Although Co and Ni can be easily recycled using traditional methods such as pyrometallurgical or hydrometallurgical processes, a significant portion of Li cannot be retrieved.
