How does voltage affect a LiFePO<sub>4</sub> battery?

The voltage rises as the battery charges and falls as it discharges. The relationship between voltage and state of charge is non-linear, meaning that a small change in SOC can cause a significant change in voltage. The following table shows the typical voltage ranges for a LiFePO<sub>4</sub> battery (single lifepo<sub>4</sub> cell) at different states of charge:

What is the minimum discharge voltage for a LiFePO<sub>4</sub> battery?

The minimum discharge voltage of a LiFePO<sub>4</sub> battery is typically around 2.5 to 2.8 volts per cell. Discharging the battery below this voltage threshold can lead to irreversible damage and significantly reduce its cycle life. To protect your LiFePO<sub>4</sub> battery and maximize its lifespan, use a battery management system (BMS) to prevent over-discharging.
