

Lithium titanate battery information

What is a lithium titanate battery?

A lithium-titanate battery is a modified lithium-ion battery that uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the anode quickly.

What is the difference between lithium titanate and other lithium ion batteries?

However, there's a critical difference between lithium titanate and other lithium-ion batteries: the anode. Unlike other lithium-ion batteries -- LFP, NMC, LCO, LMO, and NCA batteries -- LTO batteries don't utilize graphite as the anode. Instead, their anode is made of lithium titanate oxide nanocrystals.

What are the advantages of lithium titanate batteries?

Lithium titanate batteries come with several notable advantages: **Fast Charging:** One of the standout features of LTO batteries is their ability to charge rapidly--often within minutes--making them ideal for applications that require quick recharging.

What is the voltage of a lithium titanate battery?

When lithium titanate is used as the positive electrode material and paired with metal lithium or lithium alloy negative electrodes, LTO batteries can achieve a voltage of 1.5V. These alternative configurations are utilized in specialized applications where specific voltage requirements and enhanced performance characteristics are essential. 1.

What is a lithium titanate oxide (LTO) battery?

Lithium Titanate Oxide (LTO) batteries represent a significant advancement in battery technology. Unlike traditional lithium-ion batteries that use graphite anodes, LTO batteries utilize lithium titanate as their negative electrode material. This substitution brings forth several advantages, including enhanced stability and safety.

How long does a lithium titanate battery last?

The self-discharge rate of an LTO (Lithium Titanate) battery stored at 20°C for 90 days can vary. However, high-quality LTO batteries typically retain more than 90% of their capacity after 90 days of storage. **Self-discharge Rate:** The self-discharge rate refers to the capacity loss of a battery during storage without any external load or charging.

Arvio's lithium-titanate battery modules are designed for the real world. Batteries are stress tested by simulating commercial-level daily energy demands. Then the boundaries of technology are pushed by cycling twelve times a day. The results are impressive. After 14,000 cycles equivalent to 34 years of battery use there has been no degradation or loss of performance. And that's ...
