

# New energy storage charging pile heat dissipation materials

Does hybrid heat dissipation improve the thermal management performance of a charging pile?

Ming et al. (2022) illustrates the thermal management performance of the charging pile using the fin and ultra-thin heat pipes, and the hybrid heat dissipation system effectively increases the temperature uniformity of the charging module.

Can UTHPs be used to heat dissipate DC EV charging piles?

The UTHP was especially suitable for the heat dissipation of electronic equipment in narrow space. Thus it could be directly attached to the surface of the electronic components to cool the heat source. However, few researches reported on the application of UTHPs to the heat dissipation of the DC EV charging piles. Fig. 1.

Can ultra-thin heat pipes reduce the operation temperature of a charging pile?

In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat pipes (UTHPs) hybrid heat dissipation system for the direct-current (DC) charging pile. The L-shaped ultra-thin flattened heat pipe with ultra-high thermal conductivity was adopted to reduce the spreading thermal resistance.

Do UTHPs enhance the heat dissipation capacity of the charging module?

The heat dissipation performance was evaluated by the peak temperature and temperature uniformity on the chip surface. According to the simulation results, the following conclusions can be drawn: UTHPs could significantly enhance the heat dissipation capacity of the charging module.

How much heat does a fast charging pile use?

The heat power of the fast charging piles is recognized as a key factor for the efficient design of the thermal management system. At present, the typical high-power direct current EV charging pile available in the market is about 150 kW with a heat generation power from 60 W to 120 W (Ye et al., 2021).

How EV charging pile is cooled?

The typical cooling system for the high-power direct current EV charging pile available in the market is implemented by utilizing air cooling and liquid cooling. The heat removal rate of the air cooling scheme depends upon the airflow, fans, and heat sinks (Saechan and Dhuchakallaya, 2022).

In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat pipes (UTHPs) hybrid heat dissipation system for the direct-current (DC) charging pile. The L-shaped ultra-thin flattened heat pipe with ultra-high thermal conductivity was adopted to reduce the spreading thermal resistance. ICEPAK ...

In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat

pipes (UTHPs) hybrid heat dissipation system for the direct ...

1. Heat dissipation methods of energy storage modules. As the energy carrier of container-level energy storage power stations or home solar power system, the research and development design of large-capacity battery modules includes the following key technologies: system integration technology, structural design technology, electronic and electrical design ...

In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat pipes (UTHPs) hybrid heat dissipation system for the direct-current (DC) charging ...

The enhancement in energy-storage capacity for HNePCM-1\_10%, HNePCM-2\_10%, and HNePCM-3\_10% is 18.69%, 16.66%, and 6.85% higher than that of the base ...

Therefore, it is crucial to seize the technical dynamics and development trend in the field of new energy vehicle technology, strengthen the research and development of technical topics such as installation and fixation, heat dissipation and cooling, vehicle data monitoring, charging pile, vibration damping, and cable insulation materials, and improve the overall ...

Phase change material (PCM)-based thermal energy storage significantly affects emerging applications, with recent advancements in enhancing heat capacity and cooling power. This perspective by Yang et al. ...

Download Citation | On Feb 1, 2024, Zhuoni Jiang and others published Shape-stabilized phase change materials for thermal energy storage and heat dissipation | Find, read and cite all the research ...

To reduce the thermal response and improve the heat storage capacity of energy piles, a phase change (PC) energy pile was proposed. This innovative PC pile is made of concrete containing macro-encapsulated PCM

Currently, solar-thermal energy storage within phase-change materials relies on adding high thermal-conductivity fillers to improve the thermal-diffusion-based charging rate, which often leads to limited enhancement of charging speed and sacrificed energy storage capacity. Here we report the exploration of a magnetically enhanced photon ...

Here we report the first, to our knowledge, "trimodal" material that synergistically stores large amounts of thermal energy by integrating three distinct energy ...

The results showed that the PCM effectively improves the heat dissipation performance of the charging module, increasing the PCM thermal conductivity could enhance ...

Conventional phase change materials struggle with long-duration thermal energy storage and controllable latent heat release. In a recent issue of *Angewandte Chemie*, Chen et al. proposed a new concept of

# New energy storage charging pile heat dissipation materials

spatiotemporal phase change materials with high supercooling to realize long-duration storage and intelligent release of latent heat, inspiring ...

The enhancement in energy-storage capacity for HNePCM-1\_10%, HNePCM-2\_10%, and HNePCM-3\_10% is 18.69%, 16.66%, and 6.85% higher than that of the base material. Thus, HNePCMs are demonstrated to be more efficient materials and are emerging as potential materials to augment the performance of TES applications.

JONES offers a dependable solution for heat conduction, sealing, and potting to address these challenges. Charging piles employ various heat dissipation methods, including natural heat dissipation, forced air cooling, ...

The heat power of the fast charging piles is recognized as a key factor for the efficient design of the thermal management system. At present, the typical high-power direct current EV charging pile available in the market is about 150 kW with a heat generation power from 60 W to 120 W (Ye et al., 2021).
