Can multifunctional grid-connected photovoltaic systems improve power quality?

Potential solutions of power quality issues in modern power grid. The main aim of this work consists of proposing a new control strategy for multifunctional grid-connected photovoltaic systems (GCPVSs) to enhance the power quality at the point of common coupling (PCC) while considering the inverter-rated capacity.

What is a photovoltaic grid-connected cabinet?

Photovoltaic grid-connected cabinet is a distribution equipment connecting photovoltaic power station and power grid, and is the total outgoing of photovoltaic power station in the photovoltaic power generation system, and its main role is to act as the dividing point between the photovoltaic power generation system and the power grid.

Do grid-connected photovoltaic systems need a storage system?

Compared to off-grid systems,grid-connected photovoltaic systems (GCPVS) benefit from not requiring a storage system. In recent years, there has been a substantial increase in the integration of PV energy generation into the grid. However, integrating PV systems into the utility grid may cause some power quality issues [4].

Can a multiport converter reduce generation curtailment in distribution grids?

This paper analysed the multiport converter as a potential solution reduce generation curtailment in distribution grids with a high penetration of renewables. A general methodology was presented to size the required multiport converter based on an optimisation problem with electrical constraints.

Can multifunctional gcpvs improve power quality at PCC?

Conclusion In this paper, a new control strategy for multifunctional GCPVS to improve the power quality at the PCC was proposed. A two-stage grid-connected PV system employing a two-phase interleaved boost converter and a three-level neutral point clamped inverter was used to evaluate the control technique.

What is a multifunctional PV system?

Recently,PV systems,in addition to their primary role,the injection of green power into the grid,are used for current harmonics filtering and compensation of reactive power,hence the name multifunctional PV systems.
