

What is a nickel metal hydride battery?

A nickel-metal hydride battery (NiMH or Ni-MH) is a type of rechargeable battery. The chemical reaction at the positive electrode is similar to that of the nickel-cadmium cell (NiCd), with both using nickel oxide hydroxide (NiOOH). However, the negative electrodes use a hydrogen-absorbing alloy instead of cadmium.

Do nickel hydride batteries store more energy than nickel cadmium batteries?

Nickel-metal hydride batteries store more energy than nickel-cadmium batteries. The negative electrode, which is a metal hydride mixture, consists of the potassium hydroxide electrolyte and the positive electrode, the active material of which is nickel hydroxide.

Are nickel metal hydride batteries safe?

Researchers and engineers sought alternatives to the environmentally harmful cadmium used in NiCd batteries. This quest led to the development of Nickel Metal Hydride (NiMH) batteries, which offered a safer and more efficient energy storage solution.

What is the manufacturing process of nickel metal hydride (NiMH) batteries?

The manufacturing process of Nickel Metal Hydride (NiMH) batteries involves several critical stages, from raw material preparation to final quality control. Each stage is designed to ensure the production of high-quality, reliable, and safe batteries.

Can I use old chargers for nickel-metal hydride batteries?

It is not advisable to use old chargers that are only designed for NiCd batteries for nickel-metal hydride batteries. Especially if the chargers are capable of fast charging and provide high charging currents.

What is a metal hydride battery?

The term metal hydride describes a compound of metals and hydrogen. The principle of reversible storage of hydrogen in a special metal alloy was developed back in the 1960s. The nickel-metal hydride batteries based on this have been on the market since 2006.

Since the invention of nickel-cadmium (Ni-Cd) battery technology more than a century ago, alkaline batteries have made their way into a variety of consumer and professional applications, developing different electrochemical couples (Ni-Cd, Ni-metal hydride (MH)) into essentially five distinctive electrode technologies.

The negative electrode of a NiMH rechargeable battery consists of a nickel alloy that is able to store hydrogen. The material composition of the positive electrode depends on the battery's state of charge. When the battery is charged, the positive electrode consists of nickel(III) oxyhydrate.

This chapter deals with various aspects of Ni-MH batteries including merits, demerits, charging mechanism, performance, efficiency, etc. It will also provide an overview about the history of batteries.
