How to fix system battery voltage is low error?

The first solution to fix the "System battery voltage is low" error is reinserting or replacing your CMOS battery. Here are the steps: Step 1: Open the computer case and find the CMOS battery that was connected to the computer's motherboard. 1. If you can't find the CMOS battery, see your motherboard or computer documentation.

How to troubleshoot alert system battery voltage is low error message?

To troubleshoot the Alert System battery voltage is low error message while booting your computer, you need to replace the CMOS battery, set up date and time in BIOS, etc. Apart from that, you can also try updating your BIOS to get rid of this problem. Although it is pretty unusual, you might get this message on an old computer at times.

What does 'system battery voltage is low' mean?

Many people have encountered the 'System Battery Voltage is Low' Error. They generally face the error at the time of BIOS Booting. That's why sometimes you are unable to load the OS completely. It is crucial to take extreme care when you apply the troubleshooting steps.

Why is my system battery voltage low?

Whether there is a message asking that your system battery voltage is low while you power up the PC, it means that your PC is having an issue with the installation of the battery. The issue can be with the battery itself, and you must want to replace it. CMOS stands for Complementary Metal Oxide Semiconductor.

Why is my CMOS battery voltage low?

The low system battery voltage indicates an issue with the CMOS (Complementary Metal Oxide Semiconductor) battery and that it doesn't provide the required voltage. The battery plays a critical role in your PC by giving power to the BIOS firmware. In most cases, the system throws this error when the battery is worn out after years of use.

Why does my BIOS keep saying battery voltage is low?

Sometimes, you may find your boot screen gets stuck with an error message " System Battery Voltage is Low " waiting for you to press the F1 key to continue. This generally happens when the BIOS has difficulty fetching the hardware information from the CMOS. It can be caused by a depleted or faulty CMOS battery or a faulty sensor.
