What is reactive power compensation?

Reactive power is either generated or consumed in almost every component of the system. Reactive power compensation is defined as the management of reactive power to improve the performance of AC systems.

Why reactive power compensation is required? 1. To maintain the voltage profile 2. To reduce the equipment loading 3. To reduce the losses 4.

Should reactive power compensation be applied for a shorter time?

The measured data shows good agreement with the calculated one, verifying the correctness and accuracy of the proposed method. It is recommended that the reactive power compensation can be applied for a shorter time because the source current enhances substantially as the capacitance is connected to the load.

Can capacitive reactive power be used to regulate voltage?

This article presents an efficient voltage regulation method using capacitive reactive power. Simultaneous operation of photovoltaic power systems with the local grids induces voltage instabilities in the distribution lines. These voltage fluctuations cross the allowable limits on several occasions and cause economic losses.

How long should capacitive reactive power be applied?

Hence, it is recommended to apply capacitive reactive power for a short period of ~40 to 120 s. This period is enough for the tap-changers to correct the transformation ratio. The authors declare that they have no known competing financial interests or personal relationships that could have influenced the work reported in this paper.

How is capacitive reactive power produced?

The capacitive reactive power is generated through the capacitance producing devices serially or shunt connected to a load,. A significant amount of studies was devoted to the methods to produce reactive power, such as DSTATCOMs ,,STATCOM ,,and real electrical capacitors .

What is a capacitor bank?

Capacitor banks reduce the phase difference between the voltage and current. A capacitor bank is used for reactive power compensation and power factor correction in the power substations. Capacitor banks are mainly used to enhance the electrical supply quality and enhance the power systems efficiency. Go back to the Contents Table ? 2.
