

# Reasons for stopping the energy storage power station

Why is energy storage oversupply a problem?

The expansion is driven mainly by local governments and lacks coordination with new energy stations and the power grid. In some regions, a considerable storage oversupply could lead to conflicts in power-dispatch strategies across timescales and jurisdictions, increasing the risk of system instability and large-scale blackouts.

What happened to the power station?

The power station was decommissioned in 1983 and was awarded listed status. Today, the 42-acre site is part of a vast \$9bn commercial and residential development with a renovation of the turbine hall into retail space, the control room becomes a cocktail bar and luxury apartments occupy the upper levels.

Why is energy storage important in electrical power engineering?

Various application domains are considered. Energy storage is one of the hot points of research in electrical power engineering as it is essential in power systems. It can improve power system stability, shorten energy generation environmental influence, enhance system efficiency, and also raise renewable energy source penetrations.

Is excessive energy storage a threat to China's power system?

But the risks for power-system security of the converse problem -- excessive energy storage -- have been mostly overlooked. China plans to install up to 180 million kilowatts of pumped-storage hydropower capacity by 2030. This is around 3.5 times the current capacity, and equivalent to 8 power plants the size of China's Three Gorges Dam.

Why do energy storage stations have different voltage levels?

The situation is further complicated by electrochemical-energy storage stations that operate at different voltage levels, hindering the suppression of fluctuations caused by inherently variable energy sources, such as wind and sunlight. Expansion of the capacity to generate energy must align with the capacity to store it.

Why is energy storage problem a new research focus?

Therefore, storage problem for RES becomes a new research focus, and the energy storage technology thus attracts tremendous attention. China has rich RES, however, due to the inconsistency between power output period and consumption period, wind power abandoning is serious.
