

# Regular maintenance plan for new energy batteries

What are the guidelines for battery management systems in energy storage applications?

Guidelines under development include IEEE P2686 "Recommended Practice for Battery Management Systems in Energy Storage Applications" (set for balloting in 2022). This recommended practice includes information on the design, installation, and configuration of battery management systems (BMSs) in stationary applications.

Can predictive maintenance help manage energy storage systems?

This article advocates the use of predictive maintenance of operational BESS as the next step in safely managing energy storage systems. Predictive maintenance involves monitoring the components of a system for changes in operating parameters that may be indicative of a pending fault.

How often should a battery monitoring system (BMS) be calibrated?

Permanent Battery Monitoring System (BMS) calibration should be verified yearly and remember they are not able to detect bulging cells, sign of corrosion, crack post and smell of sulfuric acid.

Do battery monitors replace manual maintenance?

It is generally understood that battery monitors do not completely replace manual maintenance but it can reduce its duration and extend the intervals between them, thus generating Operating Expense (OPEX) savings.

Why are battery energy storage systems becoming more popular?

This recognition, coupled with the proliferation of state-level renewable portfolio standards and rapidly declining lithium-ion battery costs, has led to a surge in the deployment of battery energy storage systems (BESS).

Do utilities need maintenance if a fault is still recoverable?

These changes signal the need for maintenance while the fault is still recoverable. Many industries, including utilities, use this maintenance approach for assets such as power plants, wind turbines, oil pipelines, and photovoltaic (PV) systems. However, this approach has yet to be fully explored and utilized for BESS.
