Are there equivalent models for photovoltaic cells?

As the literature on the subject "equivalent models for photovoltaic cell" is very large and dispersed, the availability of a single cohesive and comprehensive document on the subject is crucial to gather information and understand the big picture.

What is the scope of a solar cell equivalent model?

The existing works within the scope of equivalent models are evaluated from 4 perspectives: error analysis, technology (material) of the solar cell, operating conditions, requirements and complexity. The main equations used to describe the physical behaviour of the solar cell were discussed.

What is the equivalent circuit of a solar cell?

The equivalent circuit of a solar cell consists of an ideal current generator in parallel with a diode in reverse bias, both of which are connected to a load. These models are invaluable for understanding fundamental device physics, explaining specific phenomena, and aiding in the design of more efficient devices.

How is a solar PV model evaluated?

The final PV solar model is evaluated in standard test conditions (STC). These conditions are kept same in all over the world and performed in irradiance of 1000 W/m^2 under a temperature of $25 \text{ }^\circ\text{C}$ in air mass of 1.5 (Abdullahi et al., 2017). Simulation of the solar PV model executes the I-V and P-V characteristics curves.

Why do we need an equivalent model for PV power plant?

The establishment of the equivalent model simplifies the detailed model, which is convenient for the planning and simulation analysis of the PV power plant, and can also accurately characterize the operating characteristics of the PV power plant, which is of great significance.

How to identify the parameters of a PV equivalent model?

In light of the defect where the capacity equal weighting is too idealized, parameter identification can be used to obtain the parameters of the PV equivalent model. The parameters of equivalent model are identified based on PV system models such as the linear dynamic system and the nonlinear black box system, as described in Section 4.1.2.
