

Can a solar power plant be hybridized with a desalination unit?

A thorough thermodynamic analysis of all the possible layouts is presented, and the different scenarios are compared in terms of efficiency and production rates and at the end, the best scenario of waste heat recovery and hybridizing the solar power plant with the desalination unit is selected and optimized using a multi-objective approach.

What are the components of a solar power plant?

This power plant mainly includes the solar collectors' field, the desalination system, and the power block. Apart from the model of the power block, which is based on the well-known and simple thermodynamic models, the models developed for the solar collectors and the desalination unit should be validated.

Can a grid-connected solar power plant reduce emissions?

Ghenai et al. [15] studied the optimized design of a grid-connected solar power plant used for cogeneration of electricity and desalinated water and found the combined system economical and, of course, with much potential for emission reduction.

How is a solar power plant validated?

For the solar power plant, the validation is carried out by comparing the results associated with the collectors' field outlet temperature and steam temperature generated by the solar working fluid with those reported in Ref. [45] for the same power plant and the same operation conditions on the 22nd of June 2009 [45].

What are the design challenges for large solar power plants?

Abstract: The development of newer technologies in concentrating solar power (CSP) plants, particularly plants using dish Stirling systems, as well as changes in the design of photovoltaic (PV) inverters is creating new challenges in the design of low- and medium-voltage collector systems for large solar power plants.

How does a solar power plant work?

As shown in Figure 1, this power plant consists of a solar field, a power block of two Gas Turbine (GT) units, one steam turbine unit, two HRSG with a simple pressure level, and one Solar Steam Generator (SSG) added to the air cooler system. The supplement of solar thermal energy provides an increase in steam mass flow of the Rankine cycle.

Ghenai et al. studied the optimized design of a grid-connected solar power plant used for cogeneration of electricity and desalinated water and found the combined system economical and, of course, with much potential for emission reduction.

Integrated Solar Combined Cycle Power Plants (ISCCs), composed of a Concentrated Solar Power (CSP)

Solar power combined production line design

plant and a natural gas-fired Combined Cycle (NGCC) power plant, have been recently introduced in the power generation sector as a technology with the potential to simultaneously reduce fossil fuel usage and the integration costs of solar power. This

To ensure large solar plants can be connected successfully to the grid without impacting grid stability or reliability, the design process must include the development of suitable models of these plants for transient and dynamic simulation. Simulation tools and models can then be used to determine special requirements to deal with issues such ...

Although the efficiency of STIG system is relatively low, its design is easier than the combined cycle [105]. The solar hybrid STIG cycle provides additional heat for steam generation and circulation through a solar collector. This technology does not require the solar collector to be heated to very high temperature as the supplementary steam needs not to be ...

The proposed effort aims to investigate efficient power generation while minimizing emissions, voltage deviations, and maintaining transmission line voltage stability. The combined heat and power of economic dispatch (CHPED) system is incorporated in the IEEE-57 bus in this presentation to ensure the best possible power flow in the transmission line while ...

The combination of thermochemical energy storage (TCES) based on calcium-looping (CaL) and concentrating solar power (CSP) is favorable as the potential choice for ...

The present work is focused on the analysis and design of sizing the optimum solar field for being implemented in the fourth unit of the combined cycle power plant "Valle de México" in Mexico. The software ...

To ensure large solar plants can be connected successfully to the grid without impacting grid stability or reliability, the design process must include the development of ...

Photovoltaics (PV) and wind are the most renewable energy technologies utilized to convert both solar energy and wind into electricity for several applications such as residential [8, 9], greenhouse buildings [10], agriculture [11], and water desalination [12]. However, these energy sources are variable, which leads to huge intermittence and fluctuation in power ...

Integrated Solar Combined Cycle (ISCC) power plants based on Parabolic Trough Concentrators (PTCs) are the most efficient way for solar into electrical energy conversion. However, due to operation in several climate conditions, ...

Integrated Solar Combined Cycle Power Plants (ISCCs), composed of a Concentrated Solar Power (CSP) plant and a natural gas-fired Combined Cycle (NGCC) power plant, have been ...

The pace of implementing solar thermal power plants is increasing all around the world. In many cases, solar plants are installed in arid areas with severe demand for potable water despite the large availability of seawater. Thus, the solar thermal power plant is combined with a thermal desalination unit for the cogeneration of electricity and sweat water. Iran is a ...

Concentrated solar power (CSP) can contribute to grid decarbonization, but its high levelized cost of electricity (LCOE) impedes widespread adoption. This study proposes hybridizing CSP and photovoltaic (PV) technologies, aiming to leverage their synergy to maximize economic benefits.
