Spherical solar cell video explanation

What is a spherical solar cell?

Large-scale spherical solar cell based on monocrystalline silicondeveloped using a corrugated architecture. Flat solar panels still face big limitations when it comes to making the most of the available sunlight each day.

How can a solar cell be made a spherical shape?

A CO 2 lasercreated the appropriate pattern in a polymeric hard mask covering the solar cell and allowed a deep reactive ion etching tool to create grooves in the exposed areas of the silicon solar cell. The flex and bend in those groove areas allowed the researchers to subsequently fold the solar cell into a spherical shape.

How do spherical solar cells work?

The spherical solar cells are shown to be able to collect and harvest sunlight three-dimensionally. More specifically, the spherical solar cell acts as a sun-tracking flat cell with the same ground area, and horizontal and vertical flat cells with twice the ground area in terms of the diffuse and reflected beam, respectively.

Does a spherical solar cell produce more power than a flat solar cell?

The results show that the spherical solar cell is capable of capturing the largest amount of back-reflected light when the aluminum cup is used with a 1 cm height, resulting in a 101% increase in power output compared to the flat solar cell with the same ground area [Figs. 2 (b)- 2 (d); Supplementary Figs. S2 and S3 and Videos S1 and S2].

Is a spherical micro solar cell the future of photovoltaics?

Check our Privacy Policy. A Japanese company, Kyosemi, is redesigning the future of photovoltaics by shunning the traditional flat substrate photovoltaic cell and opting for something more suitable for today's energy needs - the spherical micro solar cell aka the Sphelar.

Can spherical solar cells collect sunlight?

Previous solar cell designs have fabricated tiny microscale spherical cells--sometimes made with nanowires or quantum dot cells--on top of a flat surface to help better collect both direct and scattered sunlight, says Rabab Bahabry, an assistant professor of physics at the University of Jeddah in Saudi Arabia.
