What are the challenges and perspectives of single crystal perovskite solar cells?

Finally, the challenges and perspectives of single crystal perovskite solar cells are discussed in detail. The authors declare no conflict of interest. Abstract The efficiency of perovskite solar cells has increased to a certified value of 25.2% in the past 10 years, benefiting from the superior properties of metal halide perovskite materials.

Are single crystal perovskite solar cells a good choice?

Finally, the challenges and perspectives of single crystal perovskite solar cells are discussed in detail. Their superior optoelectronic properties and stability endow the organic-inorganic halide perovskite single crystals great potential for high-efficiency and stable photovoltaics.

What is a single-crystal perovskite solar cell (Sc-PSC)?

Because of several issues related to the polycrystalline form of perovskites, researchers are now focusing on single-crystal perovskite solar cells (SC-PSCs). Conventional solar cells consist of crystalline semiconductors based on Si, Ge, and GaAs.

Are PSC solar cells suitable for building-integrated PV?

This results in rigid Si solar cells not being suitable for the task, and PSCs, with the advantages of color tunability, substrate transparency and flexibility, and adjustable transparency, are the best candidates for building-integrated PV.

How a perovskite solar cell can be used for green development?

The prepared perovskite solar cell devices and modules can obtain a high PCE of 24% and 21.2%, respectively. This method certainly contributes to the green development of PSCs. Solvent-free preparation of perovskite is the most desirable strategy.

Which growth methods are adopted for single-crystal perovskite?

In this section, we summarize the most significant growth methods adopted for single-crystal perovskite: 1) solution temperature slow cooling method, 2) ITC, and 3) antisolvent method. The solubility of perovskite in a hydrohalic acid aqueous solution decreases with decreasing solution temperature.

On single crystal silicon solar cells, this texturing results in the formation of pyramidal structures that are randomly positioned, but of the same orientation. The size of these pyramids is 2-8 μm , which is considerably greater than the wavelength of light used in ellipsometry experiments, resulting in significant light scatter. One solution to this is to tilt the ...
