What are the different types of charging piles?

Charging piles are mainly divided into AC charging piles and DC charging piles. AC charging piles have a smaller body, are flexible for installation, and typically take 6-8 hours to fully charge. They are suitable for small electric vehicles and are commonly used in public parking lots, large shopping centers, and community garages.

What are electric car charging piles?

Electric car charging piles are fixed structures on the ground that provide AC electric energy for electric cars with on-board chargers using special charging interfaces and conduction modes. They have corresponding communication, charging, and safety protection functions. (How to Charge an EV imported from China)

What are the charging pile instructions?

Instructions for Charging Pile-V1.3.0: Power Output Mode: Can be switched between intelligent mode and priority mode. In intelligent mode, the charging pile power is equally distributed between the two vehicle connectors.

What is a charger Pile (Point)?

Each charger pile (point) consists of 6 60kW fully SiC-based power converter modules. For isolated charger pile design, high-voltage and high-frequency capabilities of SiC MOSFETs can simplify topologies and controls significantly. The direct benefit is power density improvement and system cost reduction.

What MOSFETs do Charger pile modules use?

Currently, charger pile modules of the state of art design and in volume production almost all use 650V Si MOSFETs in order to get a decent power density and efficiency out. For a design with power over 6 kW, 3-phase input becomes necessary.

How many power converter modules are in a charger pile?
