Additionally, considering the poor conductivity of elemental sulfur and lithium polysulfides (LiPSs), the complex charging and discharging process, and to date limited studies of low-temperature behavior and performance, the research on high-capacity low-temperature Li-S battery systems is facing multiple challenges.

When exposed to very low temperatures, the electrolyte in the battery can freeze, causing irreversible damage to the battery's internal structure. Additionally, charging a cold lithium battery can lead to the formation of metallic lithium dendrites, which can pierce the separator between the electrodes and potentially cause short circuits or even thermal runaway.
