Do micro cracks affect solar panels?

While on the one hand it is difficult to assess in detail their impact on the overall efficiency and longevity of a solar panel, they are one of the main sources of malfunctioning or even inactive cells. However, micro cracks are nearly impossible to avoid and - in the long-run - will affect most solar panels, including 'high quality' ones.

Why are solar PV cells prone to micro-cracks?

The silicon used in solar PV cells is very thin (in the range of 180 +/- 20 microns) and hence is susceptible to damage easily if the PV module's production and handling are not up to the required standards. Even slight imperfections in the PV cell can lead to large micro-cracks once it is incorporated into the PV module.

How to detect small cracks in PV modules?

Detecting small cracks in PV modules is a challenging task. These cracks can occur during production, installation and operation stages. Electroluminescence (EL) imaging test procedure is often used to detect these cracks. Defective images with linear and star cracks obtained from EL are collected.

How to prevent solar panel micro-cracks?

Three key areas must be addressed to effectively prevent solar panel micro-cracks: manufacturing, transportation/installation, and environment. Selecting a solar panel manufacturer that acknowledges the prevention of micro-cracks is a critical part of the solution.

How does a PV crack detection system work?

The flowchart of the PV crack detection system The basic principle behind a PV cell is the PV effect, which occurs when photons of light strike the surface of a semiconductor material. These photons excite electrons within the material, causing them to be released from their atoms.

What are micro-cracks & how do they affect solar power?

Micro-cracks represent a form of solar cell degradation and can affect both energy output and the system lifetime of a solar photovoltaic (PV) system.

Micro-cracks represent a form of solar cell degradation. The silicon used in the solar cells is very thin, and expands and contracts as a result of thermal cycling. During the day, the solar...
