

When to say goodbye to lead-acid batteries

Will a new generation of batteries end the lead-acid battery era?

The key to this revolution has been the development of affordable batteries with much greater energy density. This new generation of batteries threaten to end the lengthy reign of the lead-acid battery. But consumers could be forgiven for being confused about the many different battery types vying for market share in this exciting new future.

Which battery will dethrone a lead-acid battery?

The lithium-ion battery has emerged as the most serious contender for dethroning the lead-acid battery. Lithium-ion batteries are on the other end of the energy density scale from lead-acid batteries. They have the highest energy to volume and energy to weight ratio of the major types of secondary battery.

Are lead-acid batteries the cheapest?

In comparison, lead-acid battery packs are still around \$150/kWh, and that's 160 years after the lead-acid battery was invented. Thus, it may not be long before the most energy dense battery is also the cheapest battery. That has enormous implications for the future of lead-acid batteries. Another important consideration is a battery's capacity.

Are lead-acid batteries safe?

Pietro P. Lopes et al. wrote an article entitled "Past, present, and future of lead-acid batteries" (1). According to WHO (world health organization), lead is a toxic metal whose widespread use has caused extensive environmental contamination and health problems in many parts of the world (2).

What are the technical challenges facing lead-acid batteries?

The technical challenges facing lead-acid batteries are a consequence of the complex interplay of electrochemical and chemical processes that occur at multiple length scales. Atomic-scale insight into the processes that are taking place at electrodes will provide the path toward increased efficiency, lifetime, and capacity of lead-acid batteries.

Are lithium ion batteries better than lead-acid batteries?

Lithium-ion batteries are on the other end of the energy density scale from lead-acid batteries. They have the highest energy to volume and energy to weight ratio of the major types of secondary battery. That means you can pack more energy into a smaller space, and the weight will also be lower.
